

## PRODUCT SHEET

# VIRTUAL EDGE GUARD®

Virtual EdgeGuard provides secure access to enterprise resources located in the cloud, data centers, or corporate offices because the desktops (local vs. Virtual EdgeGuard) are completely isolated and no data or malicious code can cross between them.

It protects the enterprise from potential malicious code on the user's computer and prevents the export of internal/private information by that computer. Virtual EdgeGuard includes software installed on Windows PCs to provide a stateless thin client.

There is no drag and drop, copy or paste, or other interaction allowed between the secure portal and the underlying desktop. The Virtual EdgeGuard configuration is protected from alteration by malware or local admin users by proprietary AppGuard security controls.

Virtual EdgeGuard is presented as part of the alliance between Vericlave™ and Blue Ridge® Networks.
